

Problem 8

DH

Briefing

You are currently acting as the surface backup team for two mine rescue teams located underground. Approximately 28 hours ago we believe we had a major roof fall on the main line at or near an Acetylene / Oxygen cylinder storage area. The fall created significant explosion which we believe was created by the rupture of some or all of the bottles stored in the area. There was a tremendous amount of dust and smoke generated by this event. We have continued to explore the mine in an attempt to account for our people. At this time we have explored all areas of the mine with the exception of 14 Left Panel. There are currently teams on that section who are progressing toward the face area. Depending on the progress of these teams, your services may not be needed.

Fresh Air Base statement

The teams progress has come to a halt. The conditions in the area, the team has explored to, prevent further exploration. They are currently working to move a pump and get a power cable to the area. Once this has been accomplished you will begin to work.

Problem

The fan is running and ventilation is established to the fresh air base.

Fan can be turned off and on by Command Center

The mine map is up to date.

A power cable has been run to the fresh air base and a pump (cannot be moved) has been set. Power is present in the fresh air base when the pump is on. Power is not present in the fresh air base when pump is off.

You are to account for the one missing man!!!
