

SAFETY ALERT

Truck operator fatality

INCIDENT

The operator of a road-registered truck was fatally injured when the vehicle's operator cabin was inundated with rock material during loading operations at a surface bin.

An artist's impression of the truck involved in the incident after being inundated with reject from the surface bin.

CIRCUMSTANCES

Road-registered trucks transport reject material from a surface bin to the reject pad. A fleet of trucks was operating on the night shift to transport reject material. The bin operating door system can be operated in manual mode or automatic mode. In automatic mode the control system incorporates traffic lights, radio remote control and light positioning indicators.

INVESTIGATION

An investigation is currently underway.

RECOMMENDATIONS

All mines with truck loading systems incorporating a storage bin and utilising automatic or radio remote control systems should:

1. Undergo a hazard identification procedure on the system.
2. Review and assess the risk for the truck loading system, particularly if the truck cabin passes under the bin discharge.
3. Review the effectiveness of operator protection on the truck.
4. Review hazards and risk controls associated with the bin delivery system to provide an acceptable level of risk.
5. Review the electrical and mechanical engineering control systems to ensure a safety integrity level or safety category suitable for the level of risk.
6. Review against any relevant standards.
7. Review the procedures for loading the truck.

NOTE: Please ensure all relevant people in your organisation receive a copy of this Safety Alert, and are informed of its content and recommendations. The Safety Alert should be posted on the mine's noticeboard.
